WHO IS SOLTEX?

Specialty Chemical Manufacturer & Distributor

- Founded in Houston, Texas in 1986
- Technical Support & Quality Assurance Labs

Operations and ASTM Laboratory Locations:

- Houston, Texas, USA
- Baytown, Texas, USA
- Bellville, Ontario, Canada
- Louisville, Kentucky, USA

Specialized Chemicals:

- Acetylene Black
- Dielectric Fluids
- Performance Chemical Additives
- Polyalphaolefins
- Polybutene
- Refrigeration Fluids

ACETYLENE BLACK

- **Specialized Acetylene Black is characterized by:**
 - High Structure, High Purity
 - High Surface Area
 - Higher Electrical Conductivity
 - Highest Degree of Aggregation
 - Crystalline Orientation
 - High Thermal Dissipation
 - Low Metal Content; most non-detectable
- **Acetylene Black's high purity, high structure, and electrically conductive properties make it a specialty carbon additive for battery applications.**
- **AB purity has a typical carbon content of 99.9%.**
- **Available in Powder and Granular Form**
- **Polybags and Paper Bag Packaging**

ACETYLENE BLACK

How is Acetylene Black Manufactured?

Continuous exothermic decomposition of acetylene at temperatures above 1500°C without air. The yielded carbon is separated from the hydrogen, producing a high structure, high purity acetylene black. Acetylene can be sourced from either byproduct ethylene cracker or on-purpose calcium carbide.

ACETYLENE BLACK APPLICATIONS

BATTERIES

- Zinc carbon
- Zinc air
- Lithium-ion
- Lithium polymer
- Lithium sulfur dioxide
- Lithium thionyl chloride
- Sealed lead acid

FUEL CELLS

- Alkaline electrolyte
- Proton exchange membrane
- Solid polymer
- Phosphoric acid
- Molten carbonate
- Solid oxide

- AB is only 2-3% of all carbon black production.
- Approved in Military and Aerospace applications.

ACETYLENE BLACK

BENEFITS IN BATTERIES

- AB benefits from lower filler loading concentrations than carbon black.
- At equal loading concentrations, electrical conductivity is higher for AB than CB.
- AB's high purity means extremely low metals content which equates to less side reactions and less formula disruptions.
- AB's high surface area and high structure help mix and disperse in the preferred agglomerate form, forming a better electrically conductive network with many contact points.
- Acetylene black's nano-size particles integrate with Graphite's micro-size particles, improving mechanical performance and enhancing the electrically conductive network.
